

Angles for Oracle

Automate the Process of Populating BI Tools With Reporting Objects

Magnitude Angles Generator Automates The Manually-Intensive Process of Populating Each Reporting Tool With The Reporting Objects Necessary For Business Professionals To Develop Reports Without IT Assistance.

Angles Generator significantly reduces the tedious effort in implementing BI applications by fully integrating the Magnitude Angles for Oracle platform within the tool's metadata layer, saving administrators resource costs in supporting a diverse reporting environment.

Together with the operational reporting and packaged analytics capabilities offered within Angles for Oracle, Angles Generator completes the Angles BI solution providing organizations with a true end-to-end enterprise reporting solution designed to help maximize the investment in Oracle Applications.

The Angles Generator Family of Products Includes Support for The Following BI Platforms

- ✓ Oracle Business Intelligence
- ✓ Tableau
- ✓ Power BI
- ✓ Microsoft BI
- ✓ SAP BusinessObjects
- ✓ IBM Cognos BI
- ✓ QlikView
- ✓ Oracle Discoverer
- ✓ Information Builders WebFOCUS

Angles Generator for Oracle Business Intelligence

Angles BI Generator automatically connects Angles for Oracle with Oracle Business Intelligence (Oracle BI EE Plus and Oracle BI SE One). It extracts metadata from those sources and creates the Enterprise Information Model metadata layers, simplifying setup and ad hoc retrieval of database information. Angles Generator also automatically creates Angles report templates in Oracle BI Answers and Oracle Interactive Dashboards using the Angles for Oracle Answers report definitions.

Angles Generator for Microsoft Power BI

Microsoft's Power BI is a powerful tool, but before you can get started with it, you must first organize the underlying data into a business-friendly format. This can be a significant effort for Oracle EBS, which contains complex data models with thousands of tables that are notoriously difficult to report from. Angles Generator for Microsoft Power BI enables users to quickly and costeffectively translate the data access complexities into familiar, easy-to-use datasets, providing the ideal reporting foundation for any BI initiative.

Angles Generator for SAP BusinessObjects

Angles Generator automatically connects Angles for Oracle Views and Angles for Oracle Analytics with SAP BusinessObjects. It extracts metadata from those sources and creates Business Objects universes, accelerating the setup and ad hoc retrieval of Oracle business information. Angles Generator also automatically creates reports in Business Objects Web Intelligence using the Angles for Oracle Answers report definitions.

Angles Generator for QlikView

Angles Generator automatically connects Angles for Oracle Views and Angles for Oracle Analytics with QlikView. It enables users to access Oracle business information by automating the creation and security of QlikView data load scripts without requiring constant IT intervention. In addition, Angles Generator creates a data cache (QVD) layer for enterprise installations of QlikView, simplifying tedious administrative activities.

Angles Generator for Tableau

Angles Generator automatically connects Angles for Oracle Views and Angles for Oracle Analytics with Tableau for fast, cost-effective access to Oracle E-Business Suite (EBS) application data. Tableau doesn't have a semantic layer that organizes the data users can access. As a result, it can be difficult for Tableau customers to find the data they want to analyze. Angles Generator for Tableau provides Tableau users with secure access to a more business-friendly view of their Oracle EBS data, reducing the strain on IT to provide assistance.

Angles Generator for Microsoft BI

Angles Generator automatically connects Angles for Oracle Views and Angles for Oracle Analytics with Microsoft BI. It extracts metadata from those sources and creates models for Microsoft SQL Server Reporting Services (SSRS), SQL Server Analysis Services (SSAS), and Business Intelligence Semantic Model (BISM) accelerating the setup and ad hoc retrieval of Oracle business information.

Angles Generator for IBM Cognos BI

Angles Generator automatically connects Angles for Oracle Views and Angles for Oracle Analytics with IBM Cognos. It extracts metadata from those sources and creates models and packages in IBM Cognos' BI tools, accelerating the setup and ad hoc retrieval of Oracle business information. Angles Generator also automatically creates reports in Cognos Report Studio using Angles for Oracle Answers report definitions.

Angles Generator for Oracle Discoverer

Angles Generator automatically connects Angles for Oracle Views and Oracle Discoverer. It extracts metadata from Angles for Oracle Views and creates business areas for Discoverer's end-user layer, simplifying setup and ad hoc retrieval of database information.

WebFOCUS

Angles Generator for WebFOCUS

Angles Generator automatically connects Angles for Oracle Views and Angles for Oracle Analytics with Information Builders WebFOCUS. It extracts metadata from those sources and creates WebFOCUS applications, accelerating the setup and ad hoc retrieval of Oracle business information. Applications provide rich access to business data, supporting performance tuned prompts and row-level data security.
