

Process Runner Enterprise Share

Share and Collaborate on Processes Runner Files

Magnitude Process Runner Enterprise Share (EShare) is a sharing and collaboration application that extends Process Runner into an easily shareable team environment. This allows users to easily and seamlessly share and collaborate on various process files that individual users have created.

Integrated Central File Store

Allows end users to centrally store, share and collaborate on their files—right from the Process Runner interface Centralized files management. Ensure that the correct process file is always leveraged and eliminate the need for e-mail or other network-based distribution solutions for sharing process files.

Control What You Share

Designers and Process Owners have full control over what is available to other users and the mode the Process is accessible in, i.e., Read Only, Private, Shared, etc. Furthermore, each process can be password protected and locked down at the sub-process level allowing complete control on process deployment.

Dynamic Search

Dynamic search enables rapid searching through all process. Supported by various filters, users can further narrow down the search and gain access to key process files easily.

Deployment Timings

Deploy EShare at the start of your Process Runner initiatives, or at a later stage when you are ready for it, or when you reach the limitation of traditional network or e-mail based sharing capabilities. Select your timing to minimize the risk and resource impact.
